DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over EP 0537609 A2 (hereinafter "EP").

The EP reference discloses a process for oligomerizing ethylene using a catalyst comprising an aluminoxane (i.e., methylaluminoxane) and a chromium complex containing a coordinating polydentate ligand such as a 1,4,7-triazacyclononane derivative (page 2, lines 1-4 and lines 34-56). The chromium complex and aluminoxane are combined in proportions to provide Al/Cr molar ratios of from 1:1 to 10,000 to 1 (page 4, lines 1-2).

The EP reference fails to disclose that at least part of the amount of the transition metal complex is added continuously or in portions during the oligomerization.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to have modified the process of the EP reference by continuously adding an additional amount of catalyst to the oligomerization process to maintain catalytic activity in light of the EP reference disclosing the effective amount of Al/Cr molar ratios and a minimum amount of chromium required to catalyze the reaction (see page 4, lines 1-5).
